

# Gain Structure, Noise and Distortion - Knowledge Organiser

<b>GLOSSARY</b>		
<b>Impedance (Z)</b>	The amount of opposition that a circuit applies to current when a voltage is applied to it	
<b>Pre-amp</b>	An amplifier that boosts a signal to a level suitable for processing and further amplification	
<b>Phantom Power</b>	48V from a mixing desk or audio interface to provide power for condenser microphones or active DI boxes	
<b>Gain</b>	The amount of boost applied to the pre-amp stage of an audio channel	
<b>Pad</b>	Attenuates the gain by a set amount to avoid clipping	
<b>High Pass/Rumble Filter</b>	Removes frequencies below a set cut-off	
<b>Polarity/Phase Switch</b>	Inverts the polarity of a signal to avoid cancellation	
<b>Clip/Activity LEDs</b>	Light up when a signal is clipping and when a signal is going through a channel	
<b>Noise</b>	Undesired sound	
<b>Signal-To-Noise Ratio (SNR)</b>	The difference in volume between the desired signal being captured and the unwanted noise being captured	
<b>Headroom</b>	The difference in level between the loudest peaks in a signal and the point at which digital clipping starts to occur	
<b>MICROPHONE, LINE AND INSTRUMENT LEVEL</b>		
<b>← Lowest Level</b>	<b>Highest Level ⇒</b>	
<b>Microphone</b>	<b>Instrument</b>	<b>Line</b>
<ul style="list-style-type: none"> <li>• Microphone and instrument level signals require a boost from a pre-amp for them to reach a workable line level</li> <li>• Connecting a line level source to a mic level input will result in a distorted signal</li> <li>• Connecting an instrument level source to a line level input will result in a poor SNR</li> </ul>		

## SETTING GAIN LEVELS

- The dynamic range of all the audio equipment being used should be adjusted to minimise noise and undesired distortion
- The level sound be set to maximise the SNR, but not allow the peaks of the signal to clip
- The gain at each stage in the signal chain should be well above the noise floor, but with enough headroom to keep it below the point of distortion

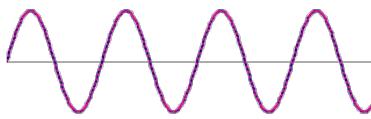

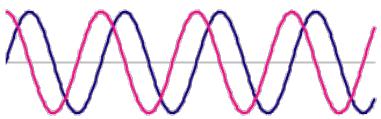

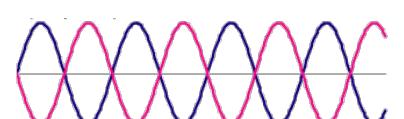

## HISS AND HUM

Low Pass Filter	High Pass Filter	Band Pass Filter
 <ul style="list-style-type: none"> <li>Used to remove hiss</li> </ul>	 <ul style="list-style-type: none"> <li>Used to remove hum</li> </ul>	 <ul style="list-style-type: none"> <li>Used to remove specific problematic frequencies</li> </ul>

## AVOIDING NOISE IN CAPTURE

- Mount microphones in shock mounts/cradles to isolate vibrations travelling up the microphone stand
- Get performers to wear closed-back headphones
- Keep the monitor mix in the headphones low
- Use acoustic screens and isolation booths

## PHASE AND POLARITY

In phase	Partially/90° out of phase	Completely/180° out of phase
		
No destructive interference	Some destructive interference	Complete cancellation of the sound
<ul style="list-style-type: none"> <li>Phase refers to a shift in time relative to an initial wave</li> <li>Polarity refers to the reversal of two connections on a cable</li> </ul>
